

TRANSCRIPT PREPARED BY THE CLERK OF THE LEGISLATURE
Transcriber's Office

March 15, 1999 LB 99

legislation. Senator Suttle did an excellent job of explaining to you the problems with diabetes, what it does, the diagnosis and some of the...some of the symptoms that come along with it. We did have a hearing in Macy and it was a resolution that I introduced to the Health Committee. I was concerned about the Native American population, what was happening to them with their diabetes problems. We had an excellent hearing. We had a lot of testimony given and most of it resolved to the fact that it's an inherited condition, but they didn't used to have the condition as badly as they have today because they have adapted to the Caucasian race diets. They do not get the exercise they used to get. Years ago, when Indians took off on a hunt, why, they took all their food in a little saddlebag called pemmican and they managed to survive on that. Today, they eat the richer diets of the European countries and they have more problems. Some of those things can be controlled. They can be controlled by diet and by exercise and, as we learned at Macy, they have...they have the exercise equipment in place, they have the...some people to help instruct the Native Americans, but they don't have enough. What they really need is support people out there to help these people get off the regime they're on and get them on the regime for support of the diabetes problem. I do support this legislation. I think it's a horrible thing, this diabetes thing. One of the things that you must understand, when Senator Suttle was talking about the symptoms, one of the end results is poor circulation and with that you see problems with the eye, where you lose...where you become blind. With that you end up with amputated limbs, maybe a toe, maybe a foot, and then maybe the leg. And I wanted to tell you about something that I had seen that was startling to me, but I saw this with my own eyes, that Dr. Otis Miller, who had a practice, a medical practice in Ord, who also did some alternative practice and one of the things he was famous for was using chelation therapy, and I saw a man come into his office one day that...he wanted Dr. Miller to see his foot and I was sitting beside Dr. Miller, so the nurse brought him in and showed this...showed Dr. Miller this man's big toe and it was just as black as Senator Bob Kremer's trousers. It looked to me like it was an amputation that should take place yesterday. Dr. Miller said, I think that we can take care of that with chelation. A month later, the toe was perfectly normal and the only treatment that man had is chelation. It took care of some of that fat
