

TRANSCRIPT PREPARED BY THE CLERK OF THE LEGISLATURE
Transcriber's Office

February 4, 1999 LB 59

with appropriations, the assumption that it is most efficient to follow, that's what we've always done, is to assume that the program made sense at the time that it passed and that it's continuing to make sense until there is a body of evidence that indicates to you it doesn't make sense. And when that happens, usually through the process of an interim study, then go ahead and pass a bill that changes it. To...to...to put on a sunset creates an artificial kind of pressure that you may or may not want. I didn't know whether to say this today, but I think you should know that the NRDs are in a crisis right now, financially, because a sunset was put on the fertilizer tax bill and the Revenue Committee just killed it. Now we're going to have to figure out what to do, and it's a major, major problem and it has to be dealt with now in a kind of crisis situation rather than dealing with it in a more deliberative process. So I don't think this process works very well and I don't know that there's a logical connection between the sunset on one...on one fund and saying, therefore, the other fund should have a sunset too. I mean, even if you believe in sunsets, there's a substantial difference between the two funds. The Litter Tax Fund is used principally for education purposes. It's the Keep America Beautiful Program. I don't know how many of you, in your communities, have had experience with that program whereby they try to involve a great many volunteers and usually do, but one could argue that maybe we don't need these volunteers going down the sides of roads and cleaning up litter or having hazardous waste disposal days when you can bring in your household waste and those sorts of things. Maybe you don't...maybe you don't think it's worthwhile to have those programs. But the fund that Senator Baker is talking about is more important than that because that's the fund by which we're discovering and finding out how to recycle things, how to make recycling work, which is a major part of our solid waste management program and in the future has to be a major part of cutting down on waste that goes into our solid waste dumps. Because those...those dumps now are very expensive because of the federal requirements and as much space as you can save in those dumps, through recycling or volume reduction at the start of the process, the better off you're going to be financially, even though it takes some money to do it at the front end. And we don't know how to do some of these things. Recycling historically is a relatively new concept. Yes, we are wasting
