

TRANSCRIPT PREPARED BY THE CLERK OF THE LEGISLATURE
Transcriber's Office

March 21, 2000 LB 1405

suggest that at least to my view there is no basis for Dr. Carhart having faculty status, which he can advertise, which appears to make him something more than he is. And if that's not the case, if we give faculty status to anybody and everybody who asks, whether or not they have any distinction of any kind, then I think maybe this body ought to be concerned and it ought to want to investigate or inquire and see if, for instance, that's how it's handled at the Harvard Medical School. This research was begun, from the report submitted by university to the Legislature, 100-plus pages in volume. It's clear that this research was begun, not as it relates to Parkinson and Alzheimer's, which has been where I have gotten most of my mail, almost exclusively on those two subjects, but rather it was begun as it relates to HIV dementia, or AIDS; I think, I want to say right now an entirely appropriate subject for research and investigation. But again, please don't manage me. I'm saying to my university, please don't manage me, please don't spin it, please don't make it something it isn't. It didn't become Parkinson's and Alzheimer's research until approximately 1997, by the university's own statements. There is no evidence that partial-birth abortion, which has been banned by this body but has been permitted by court and judicial intervention, there is no evidence that it's involved. But lest those of us who would wonder not be characterized as the crazies, I want you to know what the basis for the concern is, again I think, a fact that this body ought to want to know in the exercise of its jurisdiction. The university has stated that they are utilizing fetal tissue cells from 10 to 19 weeks. Dr. Carhart has testified in federal court under oath that he prefers to use the partial-birth abortion technique in all abortions after 15 weeks. I think it is a fair and reasonable inquiry to wonder if, between 15 weeks and 19 weeks, that technique is being used? And when the university says it isn't, I respectfully suggest they don't know. I for one, more than wanting to know whether or not we are promoting and encouraging abortion, I for one have wanted to know the answer to what I call the slippery slope question. I asked it of the expert that the university brought to testify before the committee. I asked, if this research is successful, will the therapeutic use of fetal tissue cells be required in greater and greater number? The witness literally ducked his head and said, well, that's beyond my field of expertise.
