

TRANSCRIPT PREPARED BY THE CLERK OF THE LEGISLATURE  
Transcriber's Office

March 28, 2000 LB 1405

discussion. April 12th is the last day of the session. April 11th gives people another day. I don't want another day, but there are people circulating on the floor, trying to work out various things the nature of which I don't know. But I think it is a mistake for a Legislature, composed as we are of laypersons, to try to substitute our judgment for that of scientists. Scientists leave us alone and let us, as politicians, be politicians. We, as politicians, should leave scientists alone and let them be scientists. We had people talking at the committee, and these things had been said by representatives of the Catholic Church, that when you have a basic evil act nothing good can result from it and, if there is research that is based on that evil act, the results of that research should not be used, and they talked about Nazi experimentation as an example. But, as has been pointed out, practically all of the research that has produced drugs, medication and treatments, not only for neurodegenerative...these neurological disorders, but for others, and the results are being used. So that invalidates what they are telling us. A priest came from Texas, quoting from a Harvard study about some drugs that are effective to a limited degree in dealing with the symptoms of some of these neurodegenerative disorders. What he didn't realize was that the research had been based on fetal brain tissue from elective abortions. They don't even know what they're talking about; they are so blinded by these misguided religious notions, that ought to stay in church, that they are using arguments that go directly contrary to what their argument is. I pointed out to one of the illustrious supporters of LB 1405, and he had to agree, and everybody who knows anything about history knows this, it was considered immoral, unethical and illegal to dissect human corpses; Vesalius did it and got away with it because Charles, a king with one of those last names consisting of Roman numerals, was his patron and saved him from the Inquisition because they wanted to torture him and put him through the process. But Charles stepped in and saved his donkey, excuse me, saved his hide. He had to make a pilgrimage, but when he came back, his ship got caught in a storm and he died from exhaustion, and some people would say that was his punishment. But Vesalius did a lot of work that provided a foundation for the science or field of anatomy. All kinds of advancements have been made as a result of the dissection of
