higher octane. If you lower the octane to 87, then people are going to buy the regular because they think something is wrong with ethanol anyway, but maybe the higher octane will be the incentive to buy it. So now you're going to take this suspect product, lower the octane and have it selling on a par with regular and you think people are not going to buy regular. They won't buy ethanol now, even when the prices are basically the same because they see something wrong with ethanol. The two point difference in octane will encourage some people to buy ethanol over regular, even if they don't know for sure what octane means. There is more of it, whatever it is, so take a chance with ethanol. You all don't know anything about marketing. That's where your problem is and you're going to take away the one thing that might encourage people to buy ethanol. You're going to lower the octane. You all are supposed to be the economists. You're the corn growers. You're the marketers. You know all of these things and I know nothing about any of them, but I know about practicality and I face reality. You're going to take a product whose only incentive is higher octane, that's the only incentive right now, and you're going to take that away by reducing the octane. So now I go to the pump. I'm not a scientist. Unleaded regular, octane 87, with ethanol, octane 87; ethanol, 87 cents a gallon, regular, 88 cents a gallon, penny difference, I'm going to take regular because I know what that is. Something has to be wrong with this ethanol now because it used to be 89 octane, so when they put the ethanol in it, that lowered the octane and it's not as good as it used to be even as ethanol. That is one of the craziest things I have ever heard of in my life. Now I said I'd go for corn in various varieties, but I think the ones who are pushing this bill, and I don't mean the ones on this floor, Cargill and all the others, my colleagues don't know that there are big corporations behind ethanol and they're helping to depress the prices of corn for production agriculturalists. Do you know what they've been doing with their corn? They've been turning it into liquor and they've been drinking corn liquor, and as a result, their brains are beclouded and befogged with those fumes. John Barleycorn is the one leading their choir, and as a result, they're going off in all kind of crazy directions and they got a knife and they take the knife and they stick it in themselves, and they say, by God, I did something there. They are killing themselves. You don't have scientists
