Transcriber's Office
FLOOR DEBATE

January 11, 2006 LB 454

homes, cities, states and regions in the U.S., where there are more guns, both men and women are at higher risk for homicide, particularly firearm homicide. Another one on homicide by Wiebe found that using nationally representative population survey data and mortality follow-back data on homicide and suicide victims, it was found that adults in homes with guns were at significantly higher risk of suicide and homicide than adults in homes without guns. And listen to this. The risk of homicide was particularly high among women compared with men. Another one by P.J. Cook and M. Moore found and was printed in Homicide: A Sourcebook of Social Research, at Thousand Oaks, California, and it's from a particular chapter. It reviews trends in gun ownership and examines use of guns for self-defense and for criminal purposes, concluding that gun use for self-defense is relatively rare and, secondly, while there is little evidence that robbery and assault rates are influenced by gun prevalence, there is compelling evidence of a strong association between guns and lethal, lethal robbery and assault. The relationship between instrumentality and availability of guns and homicide is explored, and public policy recommendations for reducing gun violence are made. Another one on homicide, and this one was done by A.L. Kellermann and F.P. Rivara, and N.B. Rushforth. Was printed in the New England Journal of Medicine and it says: This case-control study found that after controlling for various characteristics; for instance, neighborhood, race, age, living alone, drug use, that keeping a gun in the home was strongly associated with an increased risk of homicide victimization...homicide, excuse me. Virtually all of this risk involved homicide by a family member or intimate acquaintance. Then, when we talk about unintentional deaths, there was a study by D.J. Wiebe and it was printed in "Accident Analysis and Prevention" in 2003, and in this case-control study comparing subjects living in homes with guns to those without, the relative risk...

SENATOR CUDABACK: One minute.

SENATOR SCHIMEK: ...for dying from an unintentional gunshot injury was 3.7 times higher for adults living in homes with guns. Having handguns in the home was associated with largest effect estimates. The last one I'll mention, and I'm
